

FINAL REPORT

Government of Guam

Installation of GNSS Reference Station Installation at Memorial Hospital for GIS applications

Prepared for:

The Government of Guam

Contract Number: FA4819-15-C-0002

September, 2017

INTRODUCTION AND HISTORY

In September of 2017, Pacific GPS installed a Trimble NetR9 permanent GNSS reference station at the Memorial Hospital located in the city of Tamuning, Guam. The purpose of the reference station is for GIS applications. The permanent installation included a leveling antenna adapter that maintains a consistent point of reference in the event of antenna removal or replacement. A coordinate and ellipsoid height for this point of reference was derived by submitting multiple static data sets observed by the new reference station to the National Geodetic Survey's (NGS) Online Positioning User Service.

To further validate the integrity and usability of the new station, relative static observations were made to local NGS control monuments located within and around the cities of Tamuning and Hagatna in addition to ties to 2 local Continuously Operating Reference Stations (CORS) on the island.

The datum of the coordinate established via OPUS is NAD83(PA11), epoch of 2010.0.

In accordance with the survey regulations in Guam, Pacific GPS contracted Guam Surveyor, LLC to perform local survey observations to both verify the OPUS solution on NAD83 and provide access to the legacy Guam Geodetic Datum of 1993 and the local tidal vertical datum, if necessary.

The Pacific GPS installation was completed between September 26th and September 29th, 2017, inclusive. Technical questions or comments regarding the installation or this report can be directed to:

PERMANENT GPS BASE STATION

A Trimble Zephyr Geodetic Model 3 antenna was installed in a permanent capacity on top of the north elevator shaft of Memorial Hospital located in Tamuning, Guam.

The GNSS antenna installation hardware consists of a 2-inch diameter stainless steel mast mounted to an adapter that was cemented into 3 drill holes in the concrete roof. A leveling adaptor is fixed to the top of the mast that facilitates a permanent point of reference that remains fixed regardless of antenna removal or model change (see figure 2).

The antenna lead was routed into an existing cable chase located near the southwest corner of the elevator shaft. The cable exits the cable chase into the ceiling of the third floor northward to the server room where the Trimble NetR9 GNSS Receiver was installed. An in-line lightening arrestor was installed within the cable chase shortly before the cable exits into the ceiling.

Reference Point to Bottom of
Antenna Offset:
0.0350 meters

The Permanent GNSS Base Station is
Labeled 'GUVOV'

Figure 1. Permanent GNSS Antenna Installation

The NetR9 GNSS receiver is mounted to the wall in the Hospital server room. The receiver is programmed to record hourly and/or daily GNSS observable files internally.

Figure 2. Antenna Leveling Adapter

BASE STATION OPUS SOLUTIONS

Prior to demobilizing from Guam, 2 independent datasets were submitted to OPUS for processing. The OPUS service processes the dataset against (typically) the closes 3 CORS. In this case the CORS 'GUUG', located at the University, 'GUAM', located at Andersen AFB, and 'CNMR', located in Saipan, were used by OPUS to derive a coordinate and elevation for 'GUGOV'.

The first dataset was acquired on Julian day 270 and consisted of 20 hours of data. The second dataset was acquired on Julian day 271 and consisted of 24 hours of data. The solutions were compared to ensure that there was no significant difference in the coordinate or elevation.

The two datasets were re-submitted to OPUS after the precise ephemeris files became available. The precise ephemerides provide for more accurate relative processing, particularly over long distances.

Table 1 summarizes the OPUS solutions and the comparison between the derived coordinates. The average of the two solution represents the final, OPUS-derived coordinate and ellipsoid height on the *NAD83(PA11) coordinate datum, epoch of 2010.0*.

OPUS Solution Summary GUGOV Reference Point

Datum: NAD83(MA11); Epoch of 2010.0

APPENDIX B

NetR9 Configuration Parameters And Connection Protocols

The following are the configuration settings and connection protocols that were used during the initial setup of the NetR9 receiver. Note that the configurations can be reset and the information provided below may not be current.

NetR9 GNSS Receiver

IP Address: 192.168.246.2

You can connect to the NetR9 by plugging the Ethernet cable from the NetR9 into your PC, opening a web browser and entering the IP address into the address bar. If you cannot connect, do the following:

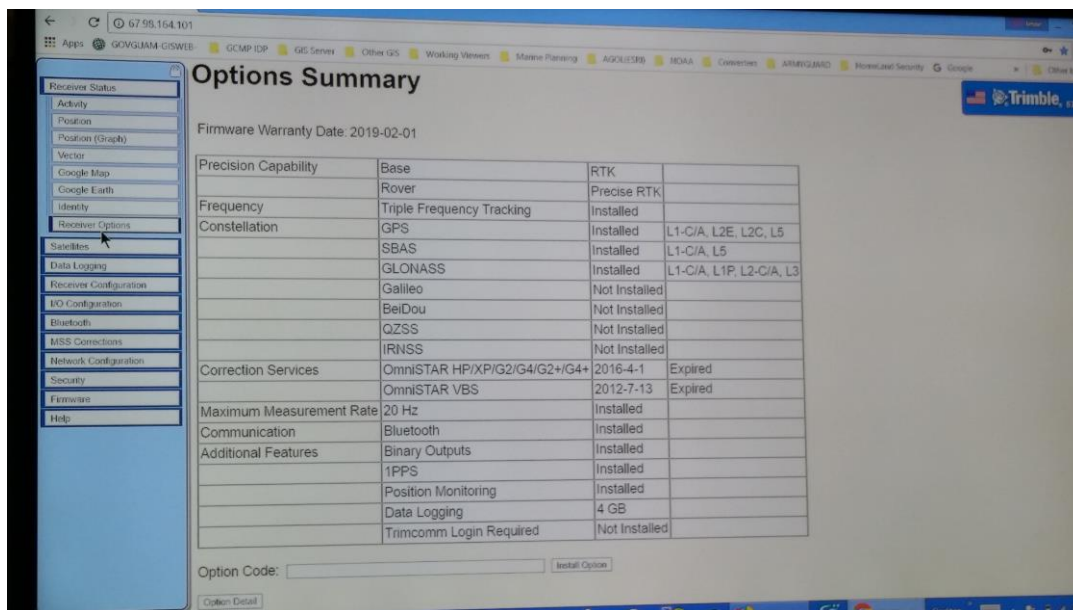

On your PC, go to: Control Panel > Network and Internet > Network Connections and right click on the Local Area Connection icon > Properties. Click on Internet Protocol Version 4 (TCP/IPv4) and click Properties. Select the "Use the following IP address:" radio button and type in 192.168.246.1. Click OK and then open a web browser and try the NetR9 IP address again.

By default, the user name and password are as follows:

User Name: admin

Password: password

Raw satellite data files are currently being stored on the NetR9 internal memory as well as being actively pushed to an FTP server location with the following server address: 192.168.144.78, server port 21. Raw data files are stored in T02 format and can be converted to RINEX format on-the-fly when downloaded. To access the raw satellite data files, connect to the NetR9 webUI as outlined above. Then navigate to Data Logging > Data Files > Directory: Internal. Then choose the file you want to open and select the raw data files you want to download. Click the Convert button to convert the files to RINEX while downloading. The files are downloaded to the directory on your PC that is specified for internet downloads (often C:\Users\[User Name]\Downloads).
